Rugged Key Identification

Mechanical keys on a ring can be exposed to a great deal of physical abrasion. Polyester adhesive backed barcode labels will not survive. Pictured, is a key labeled with an adhesive PermaLabel® tag which has a laser marked sub surface under an aluminum oxide layer and is therefore very abrasion resistant. Because the label is hardened aluminum, it is very difficult to lift an edge. Tags are available as preprints or can be printed on-site using a LabelLase® 1000 metal tag printer supplied by the company.
